Agenda

- Encoding
- Encryption
- Quantum Computing
- Historical Examples
- PKI
- SSL

Encoding

- This is **NOT** a method for securing data!
- Encoding is the process of converting data from one format into another.
- This is often done to make data easier to read, transmit, or store.
- Can be thought of akin to a translation between languages

Encryption

- The process of obfuscating easily readable data (plaintext) to be unreadable (ciphertext).
- This is accomplished through the use of some Mathematical function often involving prime numbers because it is computationally expensive to factor the product of two, large prime numbers
- The ciphertext can be converted back to plaintext if the “key” is known. In the case of RSA encryption this is the primes.

Remember Hashes?

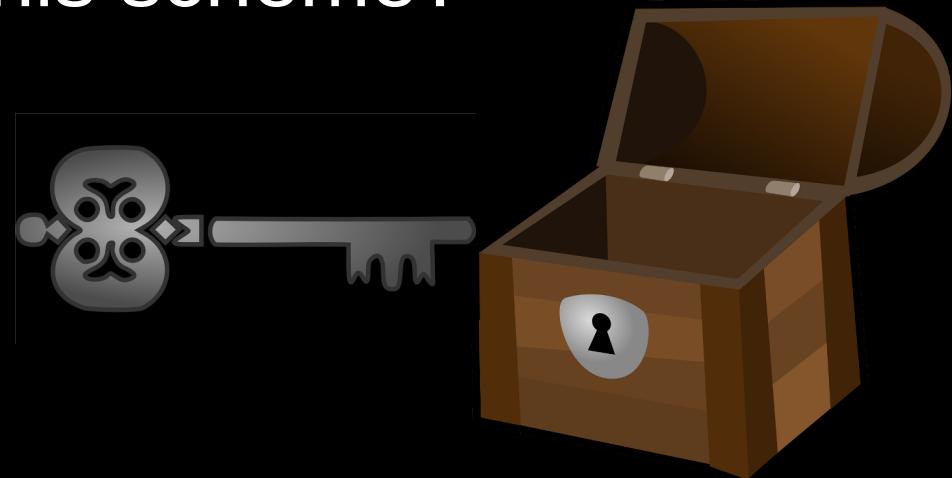

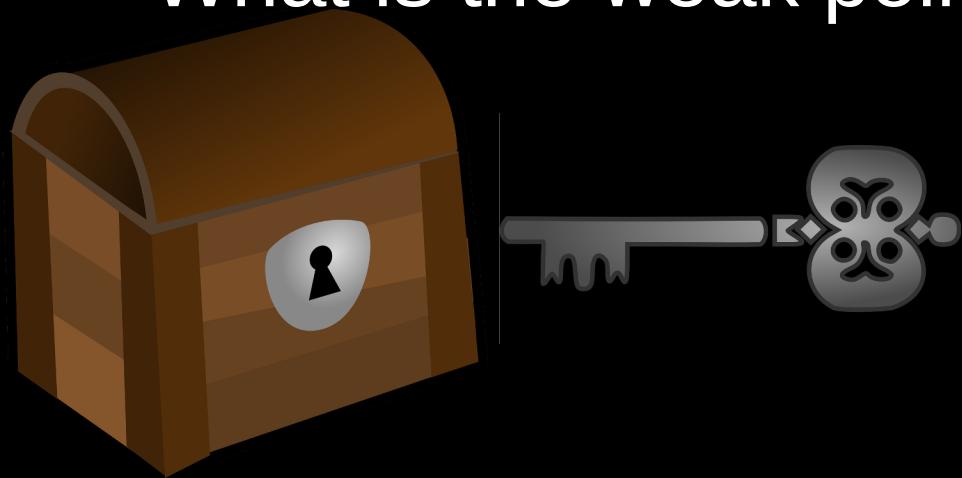

- Hashes are **NOT** a form of encryption as they are intended as a one way process.
- Once the plaintext is passed through a hashing algorithm the intent is it cannot be reversed. As we will see in Red Team there are methods for breaking weak hashes.

Encoding Vs. Encryption

- Encoding is converting a set of data into another format. Like translating English text into French. The aim is **NOT** to secure data, but to make data easier to understand, transmit, and/or store.
- Encryption is securing plaintext data into an unreadable ciphertext via the use of a mathematical algorithm. This process **CAN** be reversed with the correct key.

Symmetric Encryption

- Uses the same key to encrypt data and decrypt data.
- Commonly used to secure data “at rest” like files on your hard drive or databases.
- What is the weak point in this scheme?

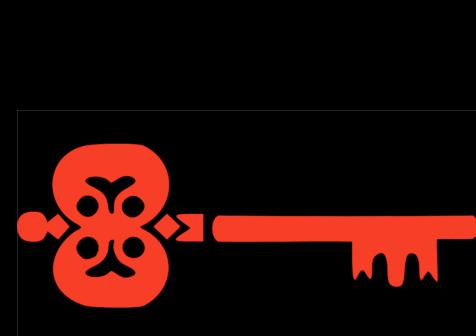

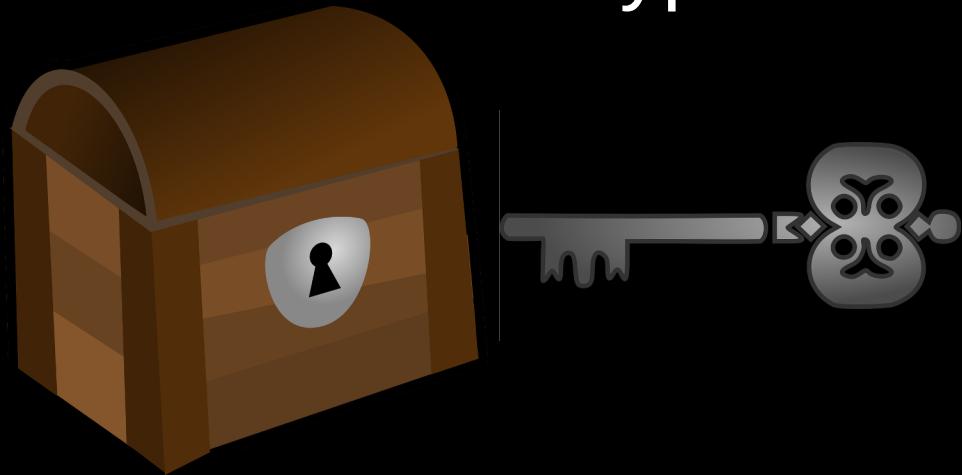

Symmetric Encryption

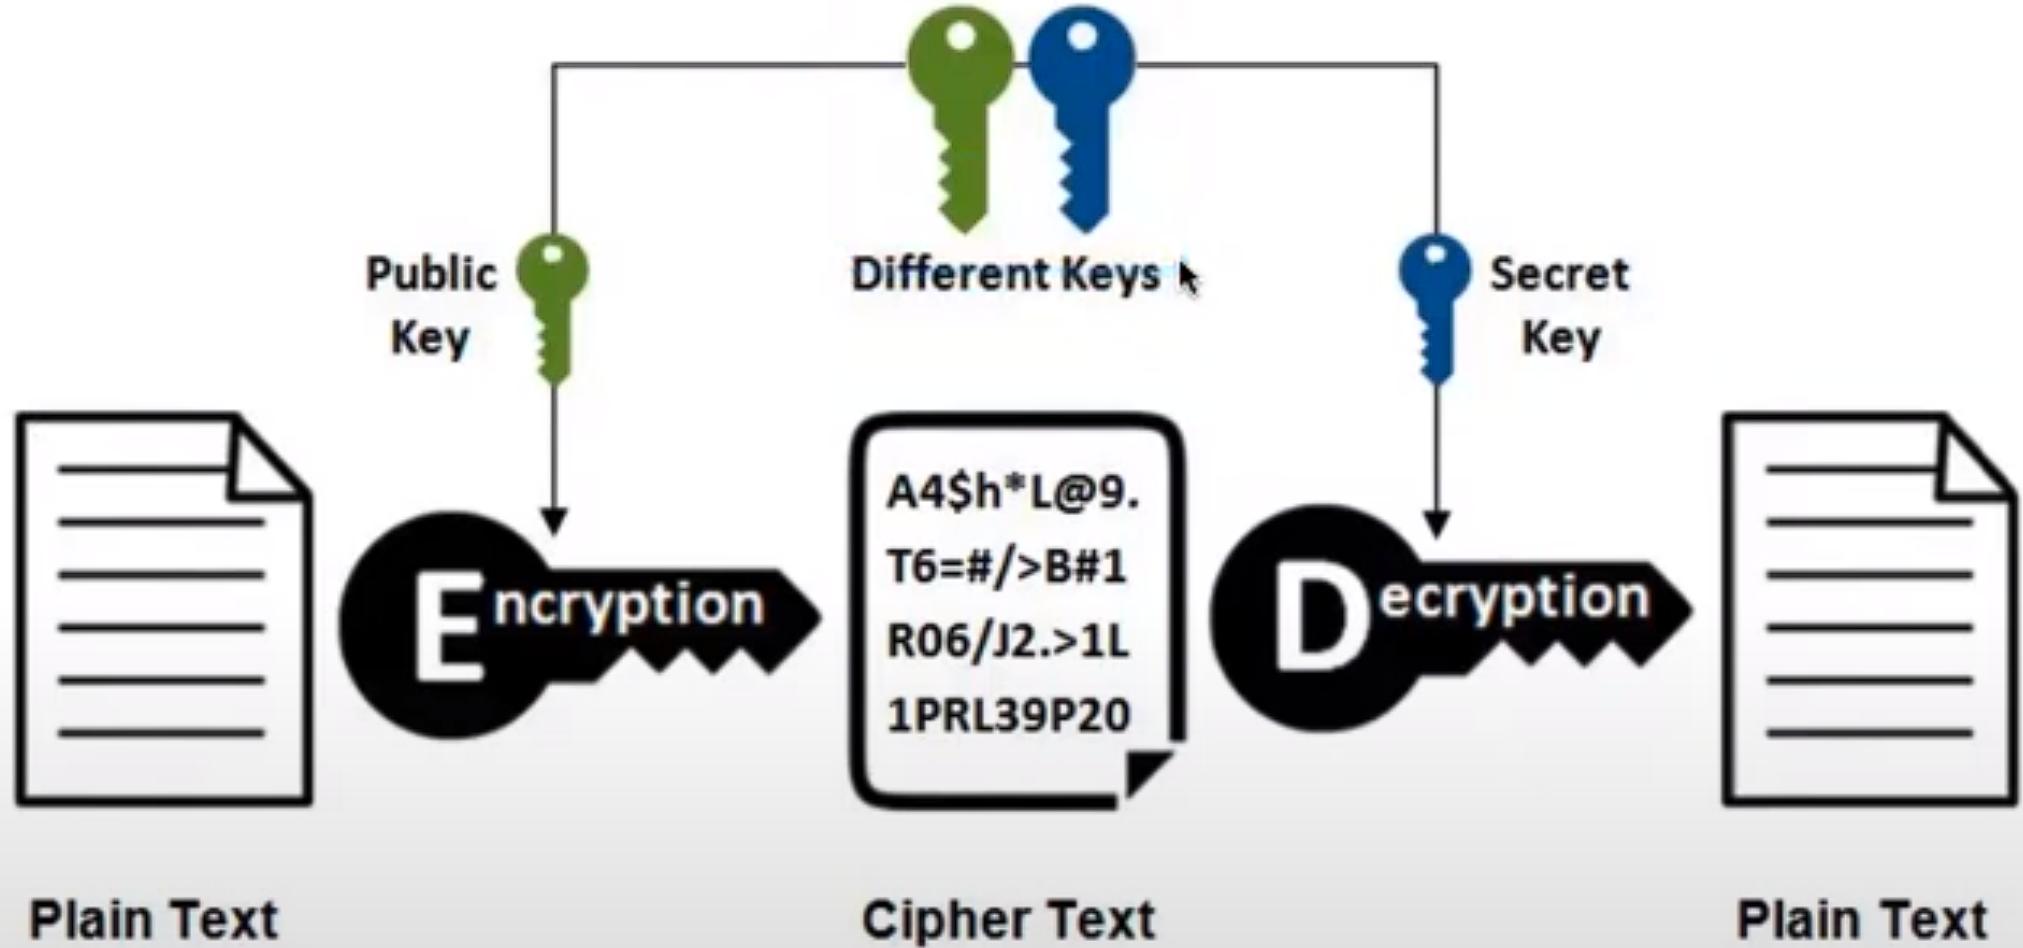

- Whoever wishes to read the plaintext data must have the key that was used to create the ciphertext.
- This means both the sender and receiver need a copy of the key.
- The issue becomes if I wish to transmit data over a public network (The Internet) I would need a method of delivering the key to the intended recipient.

Asymmetric Encryption

- Uses 2 keys to enable secure communication
- The “public key” can be transmitted over an insecure/public connection; it is **NOT** secret.
- The “private key” must be kept secret and is used to decrypt the ciphertext.

Asymmetric Encryption

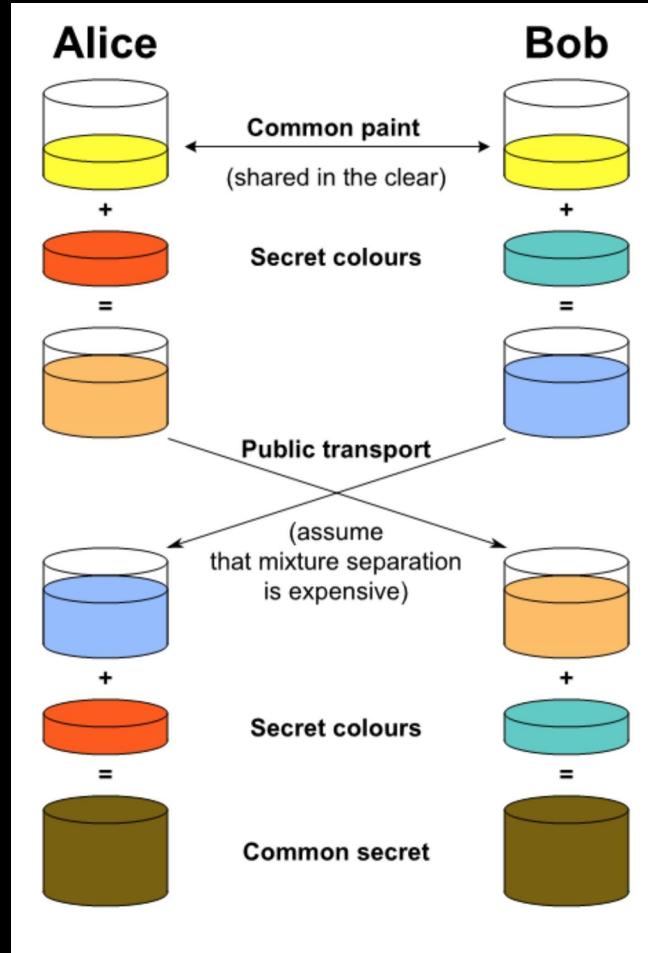

Asymmetric Encryption

- Asymmetric Encryption is great for sending and receiving secure data!
- Who can see the glaring issue with this scheme?

Diffie–Hellman key exchange

[https://null-
byte.wonderhowto.com/how-
to/generate-private-
encryption-keys-with-diffie-
hellman-key-exchange-
0180269/](https://null-byte.wonderhowto.com/how-to/generate-private-encryption-keys-with-diffie-hellman-key-exchange-0180269/)

Historical Ciphers

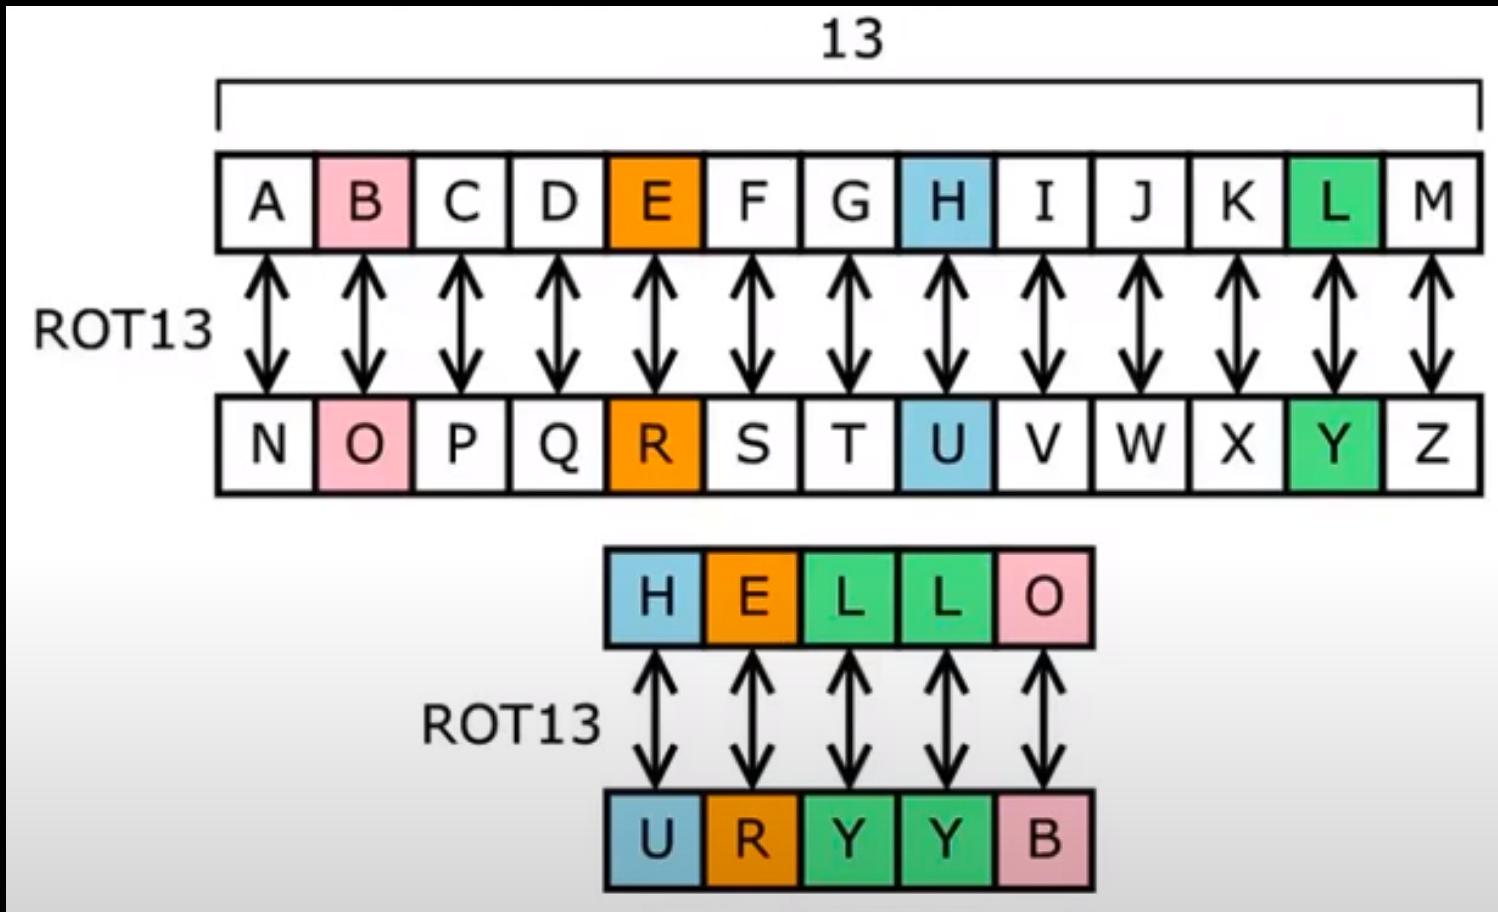

- Caesar Cipher (Rotation)
- Baconian Cipher
- Rail Fence Cipher
- Vigere Cipher
- One Time Pad

naq lbh, Oehghf?

- Caesar Cipher (ROT13). This is how Caesar Augustus send messages to his generals.
- In a Rotation Cipher the “key” is knowing how much the character-set has been rotated.
Denoted as ROT#
-

naq lbh, Oehghf?

AAAAB AAAAA AAABA ABBAB
ABBAA ABAAA AAAAAA ABBAAA
AAABA ABAAA ABBBA AABBB
AABAA BAAAA

- Attributed to Sir Francis Bacon, this is a binary substitution cipher where each letter is represented as a five letter sequence of A's and B's based on the position of the plaintext letter in the alphabet.

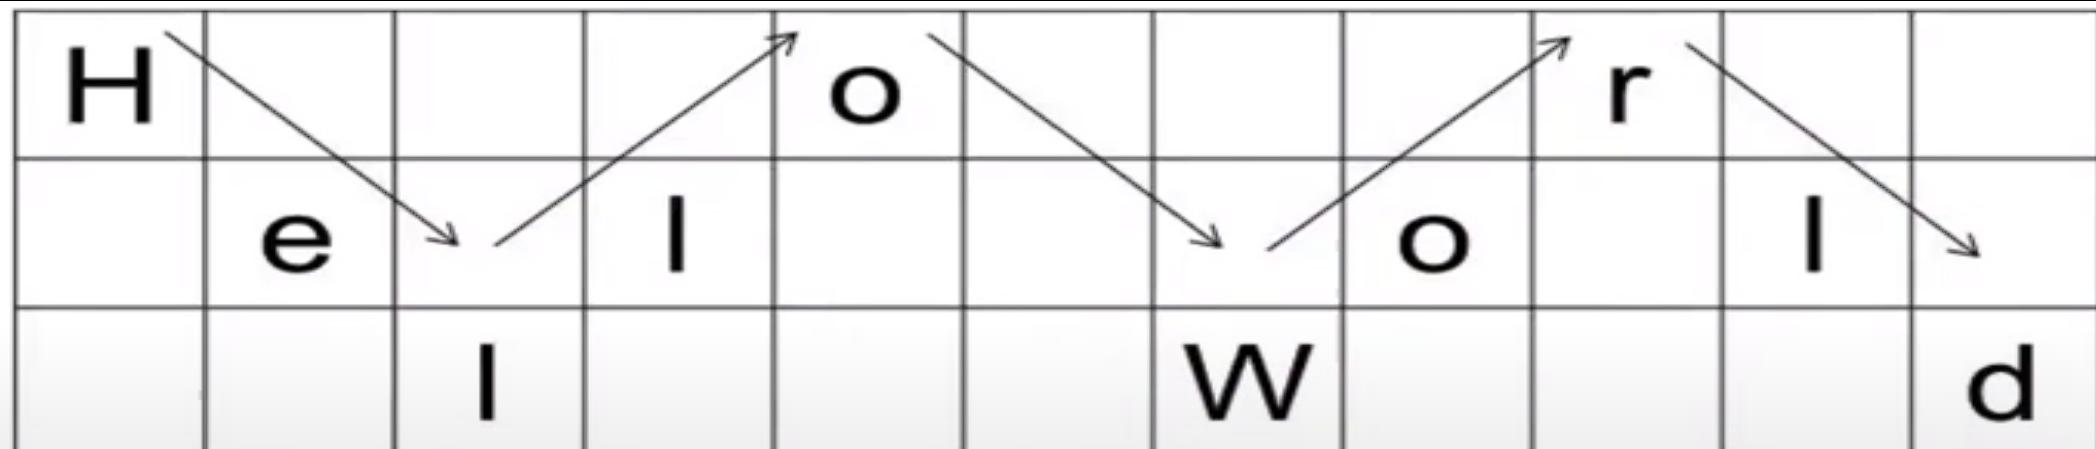

Baconian Cipher

- Historically, people will use the same 5-digit binary string for I and J and for U and V, as they follow the classical Latin alphabet.
- AABBB AABAA ABABA ABABA
ABBAB BABAA ABBAB BAAAA
ABABA AAABB

Letter	Code	Binary	Letter	Code	Binary
A	aaaaa	00000	N	abbaa	01100
B	aaaab	00001	O	abbab	01101
C	aaaba	00010	P	abbba	01110
D	aaabb	00011	Q	abbbb	01111
E	aabaa	00100	R	baaaa	10000
F	aabab	00101	S	baaab	10001
G	aabba	00110	T	baaba	10010
H	aabbb	00111	U, V	baabb	10011
I, J	abaaa	01000	W	babaa	10100
K	abaab	01001	X	babab	10101
L	ababa	01010	Y	babba	10110
M	ababb	01011	Z	babbb	10111

Rail Fence Cipher

- A transposition cipher that rearranges plaintext by zig-zagging along “rails”
- Plaintext is written diagonally from top down then down to top after the final rail is reached.
- HORELOLLWD

Vigenere Cipher

- A polyalphabetic substitution cipher.
- Each letter in plaintext is shifted by a different amount
- The “key” phrase is repeated until it matches the length of the plaintext then each plaintext is shifted according to the corresponding letter in the “key”

Vigenère Cipher

One Time Pad

- Symmetric encryption that uses a random key of the same length as the plaintext and is only used ONCE.
- Each plaintext charter is combined with the corresponding key charter using modular addition (typically XOR)
- Considered mathematically unbreakable if and only if the key is truly random.

Modern Encryption

- 7z encryption allows us to password protect compressed archives
- 7z uses Advanced Encryption Standard (AES) with a variable key length of 256bits

Modern Encryption

- GNU Privacy Guard (GPG) encryption is widely used to encrypt data and communications using public keys.
- Popular choice for securing email communications and file transfers.

Modern Encryption

- Digital Certificates are used to verify the authenticity of an entity such as a website
- Contains details such as the entity's public key and the digital signature of a trusted third party known as a Certificate Authority (CA)
- The CA is similar to vouching for a friend you know is trustworthy. The faith in trust in the CA is transferred to the other entity
- Used often on the internet especially with Transport Layer Security (TLS) encryption to verify HTTPS websites.

Modern Encryption

- Secure Socket Layer (SSL) provides encryption on the socket layer allowing us to securely transmit data over the internet.
- Again used in securing HTTPS connections

Public Key Infrastructure (PKI)

- A framework that provides for secure communication and data transfers over public networks (The Internet) using public key cryptography.
- Uses digital certificates issued by a CA to bind public keys with their user's identity.
- PKI is used across many platforms such as web browsers, secure email, and virtual private networks (VPNs).

PKI and SSL

- PKI is a framework that manages certificates and keys.
- SSL is the encryption protocol used by many services such as PKI
